# Liling Landfill Gas Project

### Project Details

<b>Activity Types</b>	Landfill Gas Capture
<b>Impact Type</b>	Avoided Emissions
<b>Oxford Category</b>	I
<b>Developer</b>	Zhuzhou Xinzhongshui Environmental Protection Technology Co., Ltd.
<b>Methodology</b>	ACM0001
<b>Crediting Period</b>	2020 - 2030
<b>Purchased From</b>	CNaught Inc.
<b>Registry</b>	Verra ( <a href="#">VCS 2503</a> )
<b>Verifying Body</b>	China Classification Society Certification Company

### Credits by Vintage

### Project Description

This project supports collection of landfill gas and generation of 3.2MW of electricity at a landfill in Liling City of Hunan Province, China. The project is expected to reduce nearly 1,000,000 tonnes of CO2e emissions during the project’s lifetime. Credits are generated from two pieces of the project: (1) avoiding the emissions of methane (a potent greenhouse gas) into the atmosphere and (2) using the power generated from the methane (natural gas) to displace dirtier coal-fired power coming from the electric grid. The project clearly required carbon revenues to achieve these two goals and therefore generates high-quality carbon offsets.

### Location

Liling, Hunan Province, China

### Risk of Reversal

This project has no risk of reversal because its avoided emissions are not subject to being undone.

### Accountability Measures

A registry-managed buffer pool exists to safeguard against project reversals. If a carbon storage project is reversed, credits from the buffer pool compensate for the shortfall, preserving environmental integrity.

# Katingan Mentaya Project

## Project Details

<b>Activity Types</b>	Avoided Deforestation, Wetland Restoration and Conservation
<b>Impact Type</b>	Avoided Emissions
<b>Oxford Category</b>	II
<b>Developer</b>	PT. Rimba Makmur Utama (PT. RMU)
<b>Methodology</b>	VM0007
<b>Crediting Period</b>	2010 - 2070
<b>Purchased From</b>	CNaught Inc.
<b>Registry</b>	Verra ( <a href="#">VCS 1477</a> )

## Project Description

The Katingan Mentaya Project protects and restores 149,800 hectares of peatland ecosystems in Indonesia. The surrounding land was drained and converted to palm and other plantations, and the project prevents the protected area from the same fate. The area is a vitally important and dense carbon sink. While peatlands represent only 0.3% of the earth's surface, their destruction contributes between 2-5% of annual anthropogenic greenhouse gas emissions. Katingan is one of the highest-regarded, large-scale avoided deforestation projects in the world.

## Risk of Reversal

Nature-based projects like this one face some risk of reversal. Carbon storage may be affected by natural hazards such as wildfires, flooding, and escalating climate change impacts. Additionally, human-driven factors such as changes in land use or local governance structures can also impact carbon storage.

## Accountability Measures

A registry-managed buffer pool exists to safeguard against project reversals. If a carbon storage project is reversed, credits from the buffer pool compensate for the shortfall, preserving environmental integrity.

# X-Hazil

### Project Details

<b>Activity Types</b>	Improved Forest Management
<b>Impact Type</b>	Removal
<b>Oxford Category</b>	IV
<b>Developer</b>	THEEARTHLAB SA de CV
<b>Methodology</b>	CAR Mexico Forest Protocol V3.0
<b>Crediting Period</b>	2021 - 2121
<b>Purchased From</b>	CNaught Inc.
<b>Registry</b>	Climate Action Reserve ( <a href="#">CAR 1863</a> )
<b>Verifying Body</b>	ANCE

### Project Description

This project focuses on Improved Forest Management through strategic interventions in forest ecosystems. It aims to enhance sustainability by implementing regeneration practices that improve tree mass structure and maintain forest coverage. The project emphasizes maintaining the functional integrity of ecosystems while implementing silvicultural treatments and Forest Stewardship Council (FSC) monitoring protocols to ensure proper forest management.

### Risk of Reversal

Nature-based projects like this one face some risk of reversal. Carbon storage may be affected by natural hazards such as wildfires, flooding, and escalating climate change impacts. Additionally, human-driven factors such as changes in land use or local governance structures can also impact carbon storage.

### Accountability Measures

A registry-managed buffer pool exists to safeguard against project reversals. If a carbon storage project is reversed, credits from the buffer pool compensate for the shortfall, preserving environmental integrity.

# Frontier Carbon Removal Portfolio

## Project Details

<b>Activity Types</b>	Long-Lived Removals
<b>Impact Type</b>	Removal
<b>Oxford Category</b>	V
<b>Developer</b>	Frontier Climate
<b>Methodology</b>	Various
<b>Crediting Period</b>	2027 and beyond
<b>Purchased From</b>	CNaught Inc.
<b>Registry</b>	None ()

## Project Description

The Frontier offtake portfolio focuses exclusively on the most innovative permanent carbon removal technologies ready to rapidly scale. Frontier technologies are highly vetted against target criteria, including the ability to store removed carbon for more than a thousand years and the potential to be low-cost and high-volume in the future, in line with 2050 climate goals. Offtake carbon removal units come from a diverse and globally distributed portfolio of the most promising carbon removal technologies, vetted by industry experts and Frontier’s team of scientists. The portfolio approach is intended to accelerate the broader carbon removal ecosystem and mitigate delivery risk. The portfolio includes a combination of: direct air capture, biomass carbon removal and storage, and other pathways as they become offtake ready.

## Risk of Reversal

These projects face low risk of reversal because they are designed to store captured carbon for hundreds or even thousands of years. The primary risk of reversal comes from failure of the storage mechanism over the promised timeframe.

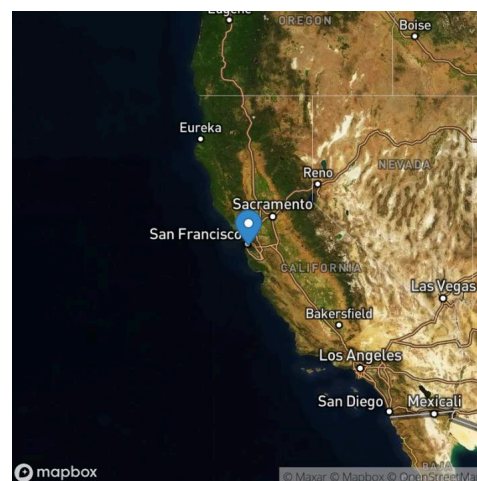

## Accountability Measures

A registry-managed buffer pool exists to safeguard against project reversals. If a carbon storage project is reversed, credits from the buffer pool compensate for the shortfall, preserving environmental integrity.

# Fuzhou Hongmiaoling Landfill Gas to Electricity Project

## Project Details

<b>Activity Types</b>	Landfill Gas Capture
<b>Impact Type</b>	Avoided Emissions
<b>Oxford Category</b>	I
<b>Developer</b>	Fujian Tianyi Renewable Energy Technology & Utilization Co., Ltd.
<b>Methodology</b>	ACM0001
<b>Crediting Period</b>	2007 - 2017
<b>Purchased From</b>	CNaught Inc.
<b>Registry</b>	Verra ( <a href="#">VCS 253</a> )
<b>Verifying Body</b>	Germanischer Lloyd Certification

## Credits by Vintage

## Project Description

This project supports collection of landfill gas and generation of 2.5MW of electricity at a landfill in Fuzhou City in Fujian Province in southeastern China. The landfill received waste from 1995 until 2008, and—like most landfills—throws off methane as some of that waste decomposes. Credits are generated from two pieces of the project: (1) avoiding the emissions of methane (a potent greenhouse gas) into the atmosphere and (2) using the power generated from the methane (natural gas) to displace dirtier coal-fired power coming from the electric grid. The project clearly required carbon revenues to achieve these two goals and therefore generates high-quality carbon offsets.

## Risk of Reversal

This project has no risk of reversal because its avoided emissions are not subject to being undone.

## Accountability Measures

A registry-managed buffer pool exists to safeguard against project reversals. If a carbon storage project is reversed, credits from the buffer pool compensate for the shortfall, preserving environmental integrity.

## Location

Fujian Province, China
